

## Resurfacing Projects

The process of resurfacing a street typically involves the removal of the existing 2-inches of pavement (milling). The surface layer under the asphalt, also known as agbase, is inspected to look for any base issues or failures that will affect the lifecycle of the pavement. If issues are found, the impacted areas are excavated and agbase (crushed rock) is installed and compacted to provide stability. After the base issue has been repaired, a tack oil is applied on top of the existing surface. This tack oil will help bind the asphalt to the existing surface and produce a durable yet flexible pavement.

## Street Marking Projects

When a street is re-marked, the existing markings are refreshed. Once the markings are removed, a street marking vehicle, using a high-powered paint sprayer, will replace the old marks with brighter cleaner road markings.

## **Streetscape Phase 5 Projects**

This phase is scheduled to extend the beautification of the Rose District. The extension will contain much of the same charm that the downtown Rose District currently has to offer. When completed, new sidewalks will be constructed, clearly painted pedestrian crossings will be marked, beautiful trees will be planted and decorative streetlights will be installed to illuminate Main Street.

## **Street Widening Projects**

These projects require an immense amount of planning and design. The first step is to acquire the right-of-way and easements of property that are impacted by the scope of the project. Once right-of-way has been obtained, any utilities impacted by construction will need to be relocated to prevent damage during construction. After re-location of the utilities is complete, construction of the new roadway can begin.
